

Citations and References

You must document any material in your thesis that is taken directly or indirectly from another source. This documentation usually consists of citations in the text where the material appears, and a reference list (works cited) or bibliography at the end of the thesis. The exact form of your text citation and references list depends on your academic discipline. It is important that you choose an established reference style that is appropriate for your field. Consult with your major professor, style guides, and/or the “Guide to Authors” from commonly used journals or books in your field, not someone else’s thesis, for examples of acceptable styles. Choose one style and use it consistently for all text citations, footnotes, and references.

Text Citations

Depending on the citation style that you use, your text citations may be in one of several forms: the author-date system, or superscript, bracketed, or parenthetical numbers that refer to footnotes at the bottom of the page, notes at the end of chapters, or notes or references at the end of the document. **You should always include the source’s page number(s) when citing a direct quote.**

References List/Bibliography

A references list/bibliography is required in all theses that cite sources. How to reference literature and construct a bibliography, and examples of reference styles are given in many style guides available in bookstores and the library, and in the “Guide to Authors” found in scholarly journals. You should use the bibliographic style of your own discipline.

- Format the bibliography heading like the other top level/chapter headings of the thesis. If chapter numbering is used, do not number the bibliography heading.
- Number references only if using numbers to cite references in the text. Number references either in the order they are first referred to in the text or alphabetically by first author’s last name.
- Use indentation and/or space between references so that each entry is easy to find.
- Pay special attention to the punctuation, spacing, capitalization, and the arrangement of the information included in each listed reference so that each entry is complete and consistently matches the reference style you are following.

References for Internet Sources of Information

Sources of scholarly information are often found on the Internet, but the *URL* may move over time or disappear. The bibliography format for a reference to an on-line source is very usually similar to the format of a journal article reference: The name of the author is listed first (if available); the title of the web page is listed (formatted similarly to a journal article title); the name of the web site is listed (formatted similarly to the name of a journal); the year of publication is included in a similar manner to the year or date of other references; the *URL* of each specific page you are citing and the date you last accessed that page of the web site are listed at the end of the reference, in most cases. In the text, the citation consists of the first item listed in the reference section (the author’s name, if available; otherwise the title of the web page, followed by the year). If your style guide lists the order of these items differently, follow that style, but list complete information, even if your style guide does not require it.
